

CASKET BED FRAME ASSEMBLY

ABSTRACT OF THE DISCLOSURE

An assembly for construction into a casket bed frame for supporting a body. The casket bed frame includes a rectangular frame formed of a pair of first rails and second rails wherein a plurality of corrugated metal strips extend between the second rails. The rails of the metal frame advantageously interlock at their ends to form the rectangular frame without the use of tools. A plurality of lances are spaced along each of the second rails and are configured to extend through holes in the ends of the corrugated strips for easy attachment of the strips to the second rails. The rectangular frame may be further reinforced, and the stretcher springs supported, by a pair of stretcher supports that each have crimped ends configured to extend over and embrace the first rails.
